

Employee Attrition Analysis – Executive Summary

Objective

The objective of this analysis was to identify the key factors associated with employee turnover and provide practical recommendations to help improve employee retention.

Key Findings

- Approximately 16.1% of employees in the dataset left the organization.
- The Sales department recorded the highest turnover rate (20.63%).
- Within job roles, Sales Representatives experienced the highest turnover (39.76%), followed by Laboratory Technicians (23.94%) and Human Resources employees (23.08%).
- Employees who frequently worked overtime or travelled often for work were more likely to leave.
- Salary alone did not explain why employees resigned. Workload, job responsibilities, travel requirements, and overall work experience had a greater influence on retention.

Recommendations

1. Prioritize retention efforts in the Sales department, particularly for Sales Representatives.
2. Monitor employees who regularly work overtime and review workload distribution to improve work-life balance.
3. Conduct regular career development and retention discussions with employees in high-turnover roles.
4. Strengthen learning, growth, and internal career progression opportunities for employees during their early years with the company.

Important Consideration

This analysis should be used as a decision-support tool rather than the sole basis for HR decisions. Individual circumstances such as personal reasons, external job opportunities, and manager feedback should always be considered before taking action.

Expected Business Impact

Implementing these recommendations can help the organization reduce employee turnover, improve employee satisfaction, and lower recruitment and training costs. By identifying departments and roles with higher turnover, HR can focus its efforts where they will have the greatest impact. Retaining experienced employees also helps maintain productivity, preserve organizational knowledge, and improve overall team performance.

Future Improvements

This analysis can be enhanced by incorporating additional information such as employee engagement survey results, manager feedback, promotion history, training participation, absenteeism, and exit interview data.
